

Case Study

Project Overview

One of our critical fuel distribution customers approached us to assist in the inspection, cleaning, repair and maintenance of the major fuel farm at one of their busiest delivery hubs. During the work, site operations were to continue in a totally safe and efficient manner.

Solution

Our experts worked alongside the customer's key staff in Safety and Environment, Operations and Engineering to fully understand the nuances of the task, advise on legislation and create a safe working program for their needs.

The resulting program encompassed drain down, cleaning and gas freeing, surface preparation and complete NDT inspections in line with HSGE Guidance. Advance coating systems were then applied before the tanks were returned to service with a newly extended life span.

Outcome and results

The whole project was completed on time and under budget. Malary's unique processing services recycled the redundant waste fuel and converted it into light distillate fuel. This reduces the need for virgin hydrocarbon-based fuels. Our customer's satisfaction was confirmed by the instruction to undertake further work at another critical location.
